I'm a Frontend Developer, mainly focused on mobile, with 2 years of experience in the profession. I'm located in Novi Sad, Serbia. I like to present myself as a very independent individual who is responsible and easy to communicate. I'm transparent, open-minded and concise. I'm capable of delivering fast in a fast-paced environment, but in general - I like to deliver tasks in the best possible quality. I'm collaborative and I like working in a team. Overall, I'm an enthusiastic and passionate person who is in love with their job, and genuinely a nice person.

| Python | Django | GraphQL | RESTful | Fastlane |
| App Store releases and management | | | | |

## Projects

### Property management platform

I was an early member of a team that has since grown to include over 10 developers. I have contributed to the development of several frontend features from the ground up, as well as working on a number of backend improvements. My primary focus was on building a cross-platform mobile app using React Native. Some of my responsibilities on the project included:

- Implementing UI and client-side logic for mobile and web applications using React and React Native
- Implementing a GraphQL API on the frontend
- Setting up automated releases for the App Store and TestFlight using Fastlane
- Managing App Store releases
- Implementing backend features and a GraphQL API using Django and Graphene
- Providing code review for other team members.

### Dating App

I have assisted a small startup team in building a dating app that is centered around the user's contact list. The app was developed using React Native. Some of the challenges I faced included integrating an iMessage chat bot with the React Native app and managing the user's contact list in a variety of edge cases. I worked closely with the backend developer to make technical decisions and helped the rest of the team with product development, UI design, and UX design.

### Audio Based Social Network

I was responsible for the frontend development using React Native and implementing a RESTful API for a client's MVP of a cross-platform mobile audio-based social network. I faced challenges such as utilising device APIs for audio recording and determining the optimal UI and UX practices for a unique product.As this was in the early stages of product development, I played a significant role in making product decisions.
